

ChemLogic Cassette Handling

DOD ChemLogic cassettes are designed for use in colorimetric based gas monitoring systems. Since this is a particular end-use function and does not release or result in exposure to hazardous chemicals under normal use Material Safety Data Sheets (MSDS) are not required.

ChemLogic cassettes are non-toxic and require no special precautions for protection. However contact with skin may cause the cassette to react, change color, and no longer be useful in your gas monitoring system. We therefore recommend that rubber gloves be worn at all times while handling including removal and installation. Always wash hands as a precaution after handling DOD ChemLogic cassettes.

ChemLogic cassettes are factory sealed in a foil type plastic and cardboard box to maximize freshness until ready to use. This safeguards the treated paper from unnecessary exposure to air, light, and moisture. Storing the ChemLogic tapes at recommended temperatures after receipt as indicated on the label ensures optimal performance once installed.
